MB90591/F591A/594/594G/F594A/F594G MB90V590A/V590G

■ DESCRIPTION

The MB90590/590G series with two FULL-CAN*¹ interfaces and FLASH ROM is especially designed for automotive and industrial applications. Its main features are two on board CAN Interfaces, which conform to V2.0 Part A and Part B, while supporting a very flexible message buffer scheme and so offering more functions than a normal full CAN approach.

The instruction set of F²MC-16LX CPU core inherits an AT architecture of the F²MC*² family with additional instruction sets for high-level languages, extended addressing mode, enhanced multiplication/division instructions, and enhanced bit manipulation instructions. The microcontroller has a 32-bit accumulator for processing long word data.

The MB90590/590G series has peripheral resources of 8/10-bit A/D converters, UART (SCI), extended I/O serial interface, 8/16-bit PPG timer, I/O timer (input capture (ICU), output compare (OCU)), stepping motor controller, and sound generator.

*1: Controller Area Network (CAN) - License of Robert Bosch GmbH

*2: F²MC stands for FUJITSU Flexible Microcontroller.

■ FEATURES

- Clock
 - Embedded PLL clock multiplication circuit
 - Operating clock (PLL clock) can be selected from divided-by-2 of oscillation or one to four times the oscillation (at oscillation of 4 MHz, 4 MHz to 16 MHz).
 - Minimum instruction execution time: 62.5 ns (operation at oscillation of 4 MHz, four times the oscillation clock, V_{CC} of 5.0 V)

■ PACKAGE

100-pin Plastic QFP

(FPT-100P-M06)

MB90590/590G Series

(Continued)

- Instruction set to optimize controller applications
 - Rich data types (bit, byte, word, long word)
 - Rich addressing mode (23 types)
 - Enhanced signed multiplication/division instruction and RETI instruction functions
 - Enhanced precision calculation realized by the 32-bit accumulator
- Instruction set designed for high level language (C language) and multi-task operations
 - Adoption of system stack pointer
 - Enhanced pointer indirect instructions
 - Barrel shift instructions
- Program patch function (for two address pointers)
- Enhanced execution speed: 4-byte instruction queue
- Enhanced interrupt function: 8 levels, 34 factors
- Automatic data transmission function independent of CPU operation
 - Extended intelligent I/O service function (EI²OS): Up to 10 channels
- Embedded ROM size and types
 - Mask ROM: 256 Kbytes/384 Kbytes
 - Flash ROM: 256 Kbytes/384 Kbytes
 - Embedded RAM size: 6 Kbytes/8 Kbytes
- Flash ROM
 - Supports automatic programming, Embedded Algorithm ™*
 - Write/Erase/Erase-Suspend/Resume commands
 - A flag indicating completion of the algorithm
 - Hard-wired reset vector available in order to point to a fixed boot sector in Flash Memory
 - Erase can be performed on each block
 - Block protection with external programming voltage
- Low-power consumption (stand-by) mode
 - Sleep mode (mode in which CPU operating clock is stopped)
 - Stop mode (mode in which oscillation is stopped)
 - CPU intermittent operation mode
 - Clock mode
 - Hardware stand-by mode
- Process
 - 0.5μm CMOS technology
- I/O port
 - General-purpose I/O ports: 78 ports
- Timer
 - Watchdog timer: 1 channel
 - 8/16-bit PPG timer: 8/16-bit × 6 channels
 - 16-bit re-load timer: 2 channels
- 16-bit I/O timer
 - 16-bit free-run timer: 1 channel
 - Input capture: 6 channels
 - Output compare: 6 channels
- Extended I/O serial interface: 1 channel
- UART (3 channels)
 - With full-duplex double buffer (8-bit length)
 - Clock asynchronized or clock synchronized (with start/stop bit) transmission can be selectively used.
- Stepping motor controller (4 channels)

- External interrupt circuit (8 channels)
A module for starting an extended intelligent I/O service (EI²OS) and generating an external interrupt which is triggered by an external input.
- Delayed interrupt generation module
Generates an interrupt request for switching tasks.
- 8/10-bit A/D converter (8 channels)
8/10-bit resolution can be selectively used.
Starting by an external trigger input.
- FULL-CAN interfaces: 2
Conforming to Version 2.0 Part A and Part B
Flexible message buffering (mailbox and FIFO buffering can be mixed)
- Sound generator
- 18-bit Time-base counter
- Clock timer: 1 channel
- External bus interface: Maximum address space 16 Mbytes

■ HANDLING DEVICES

(1) Preventing latch-up

CMOS IC chips may suffer latch-up under the following conditions:

- A voltage higher than V_{CC} or lower than V_{SS} is applied to an input or output pin.
- A voltage higher than the rated voltage is applied between V_{CC} and V_{SS} .
- The AV_{CC} power supply is applied before the V_{CC} voltage.

Latch-up may increase the power supply current drastically, causing thermal damage to the device.

For the same reason, also be careful not to let the analog power-supply voltage (AV_{CC} , AV_{RH} , DV_{CC}) exceed the digital power-supply voltage.

(2) Treatment of unused pins

Leaving unused input pins open may result in misbehavior or latch up and possible permanent damage of the device. Therefore they must be pulled up or pulled down through resistors. In this case those resistors should be more than 2 k Ω .

Unused bidirectional pins should be set to the output state and can be left open, or the input state with the above described connection.

(3) Using external clock

To use external clock, drive X0 pin only and leave X1 pin unconnected.

Below is a diagram of how to use external clock.

Using external clock

MB90590/590G Series

(4) Power supply pins (V_{CC}/V_{SS})

In products with multiple V_{CC} or V_{SS} pins, pins with the same potential are internally connected in the device to avoid abnormal operations including latch-up. However, you must connect the pins to an external power and a ground line to lower the electro-magnetic emission level to prevent abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total current rating.

Make sure to connect V_{CC} and V_{SS} pins via lowest impedance to power lines.

It is recommended to provide a bypass capacitor of around 0.1 μ F between V_{CC} and V_{SS} pin near the device.

(5) Pull-up/down resistors

The MB90590/590G Series does not support internal pull-up/down resistors. Use external components where needed.

(6) Crystal Oscillator Circuit

Noises around X0 or X1 pins may cause abnormal operations. Make sure to provide bypass capacitors via the shortest distances from X0, X1 pins, crystal oscillator (or ceramic resonator) and ground lines, and make sure that lines of oscillation circuits do not cross the lines of other circuits.

A printed circuit board artwork surrounding the X0 and X1 pins with a ground area for stabilizing the operation is highly recommended.

(7) Turning-on Sequence of Power Supply to A/D Converter and Analog Inputs

Make sure to turn on the A/D converter power supply (AV_{CC}, AVR_H, AVR_L) and analog inputs (AN0 to AN7) after turning-on the digital power supply (V_{CC}).

Turn-off the digital power after turning off the A/D converter supply and analog inputs. In this case, make sure that the voltage does not exceed AVR_H or AV_{CC} (turning on/off the analog and digital power supplies simultaneously is acceptable).

(8) Connection of Unused Pins of A/D Converter

Connect unused pins of A/D converter to AV_{CC} = V_{CC}, AV_{SS} = AVR_H = V_{SS}.

(9) N.C. Pin

The N.C. (internally connected) pin must be opened for use.

(10) Notes on Energization

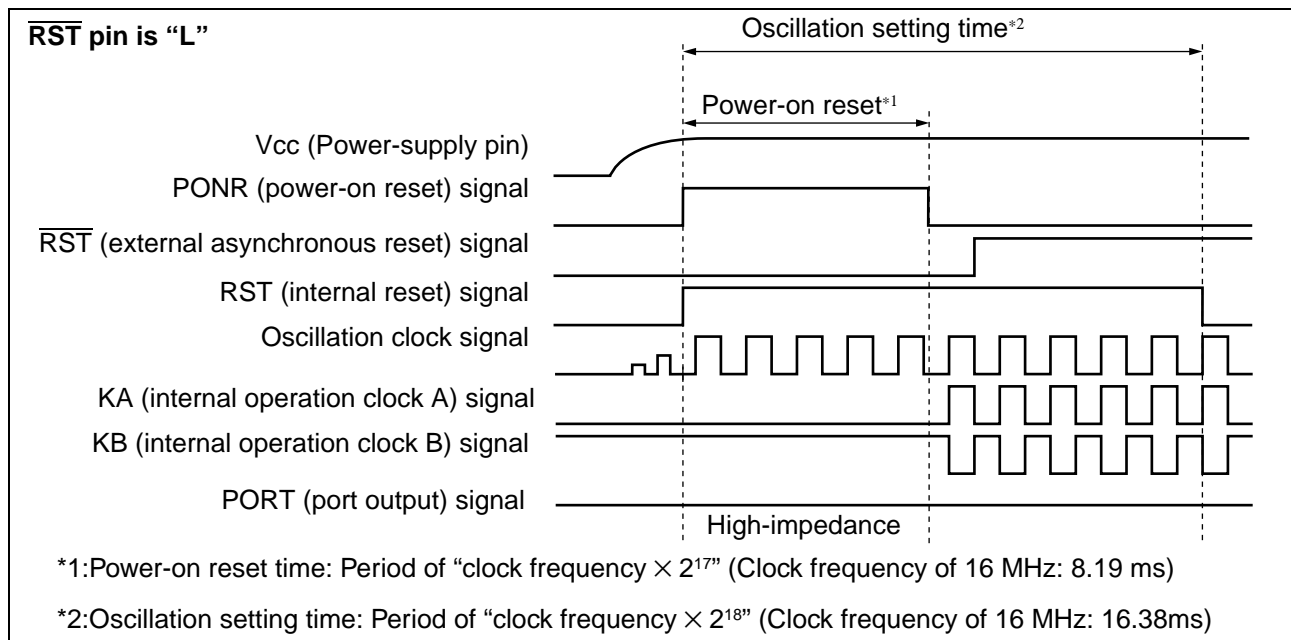

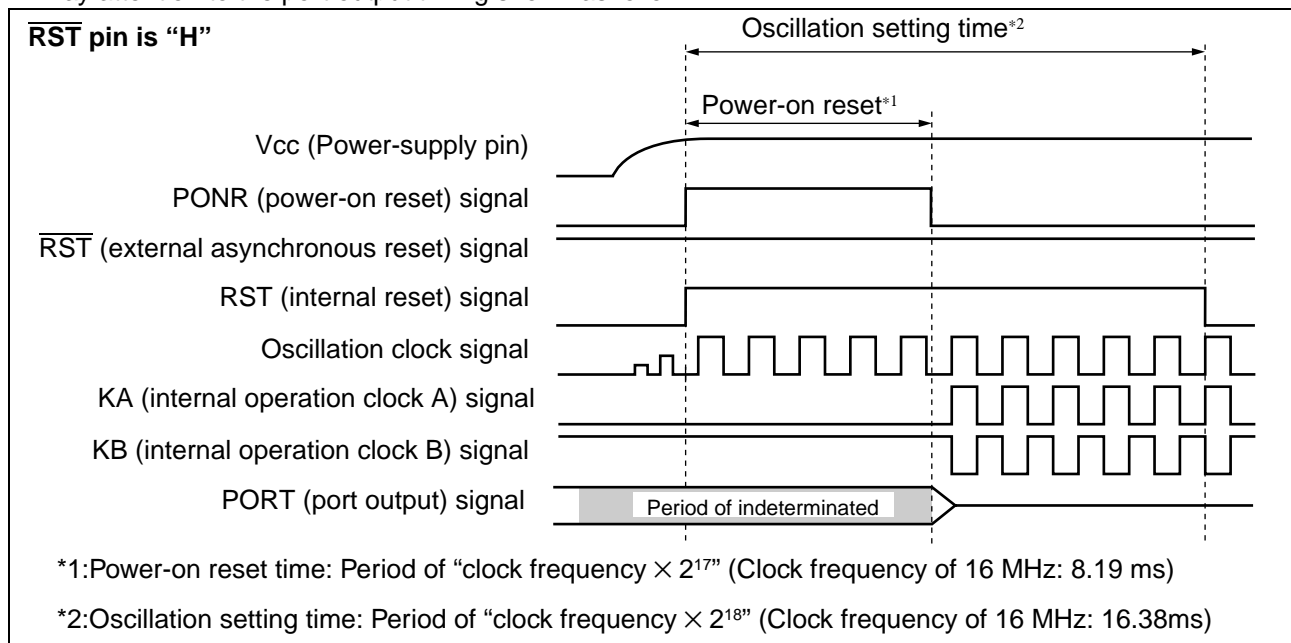

To prevent the internal regulator circuit from malfunctioning, set the voltage rise time during energization at 50 μ s or more (0.2 V to 2.7 V).

(11) Indeterminate outputs from ports 0 and 1

During oscillation setting time of step-down circuit (during a power-on reset) after the power is turned on, the outputs from ports 0 and 1 become following state.

- If $\overline{\text{RST}}$ pin is "H", the outputs become indeterminate.
- If $\overline{\text{RST}}$ pin is "L", the outputs become high-impedance.

Pay attention to the port output timing shown as follow.

(12) Initialization

The device contains internal registers which are initialized only by a power-on reset. To initialize these registers, please turn on the power again.

(13) Directions of “DIV A, Ri” and “DIVW A, RWi” instructions

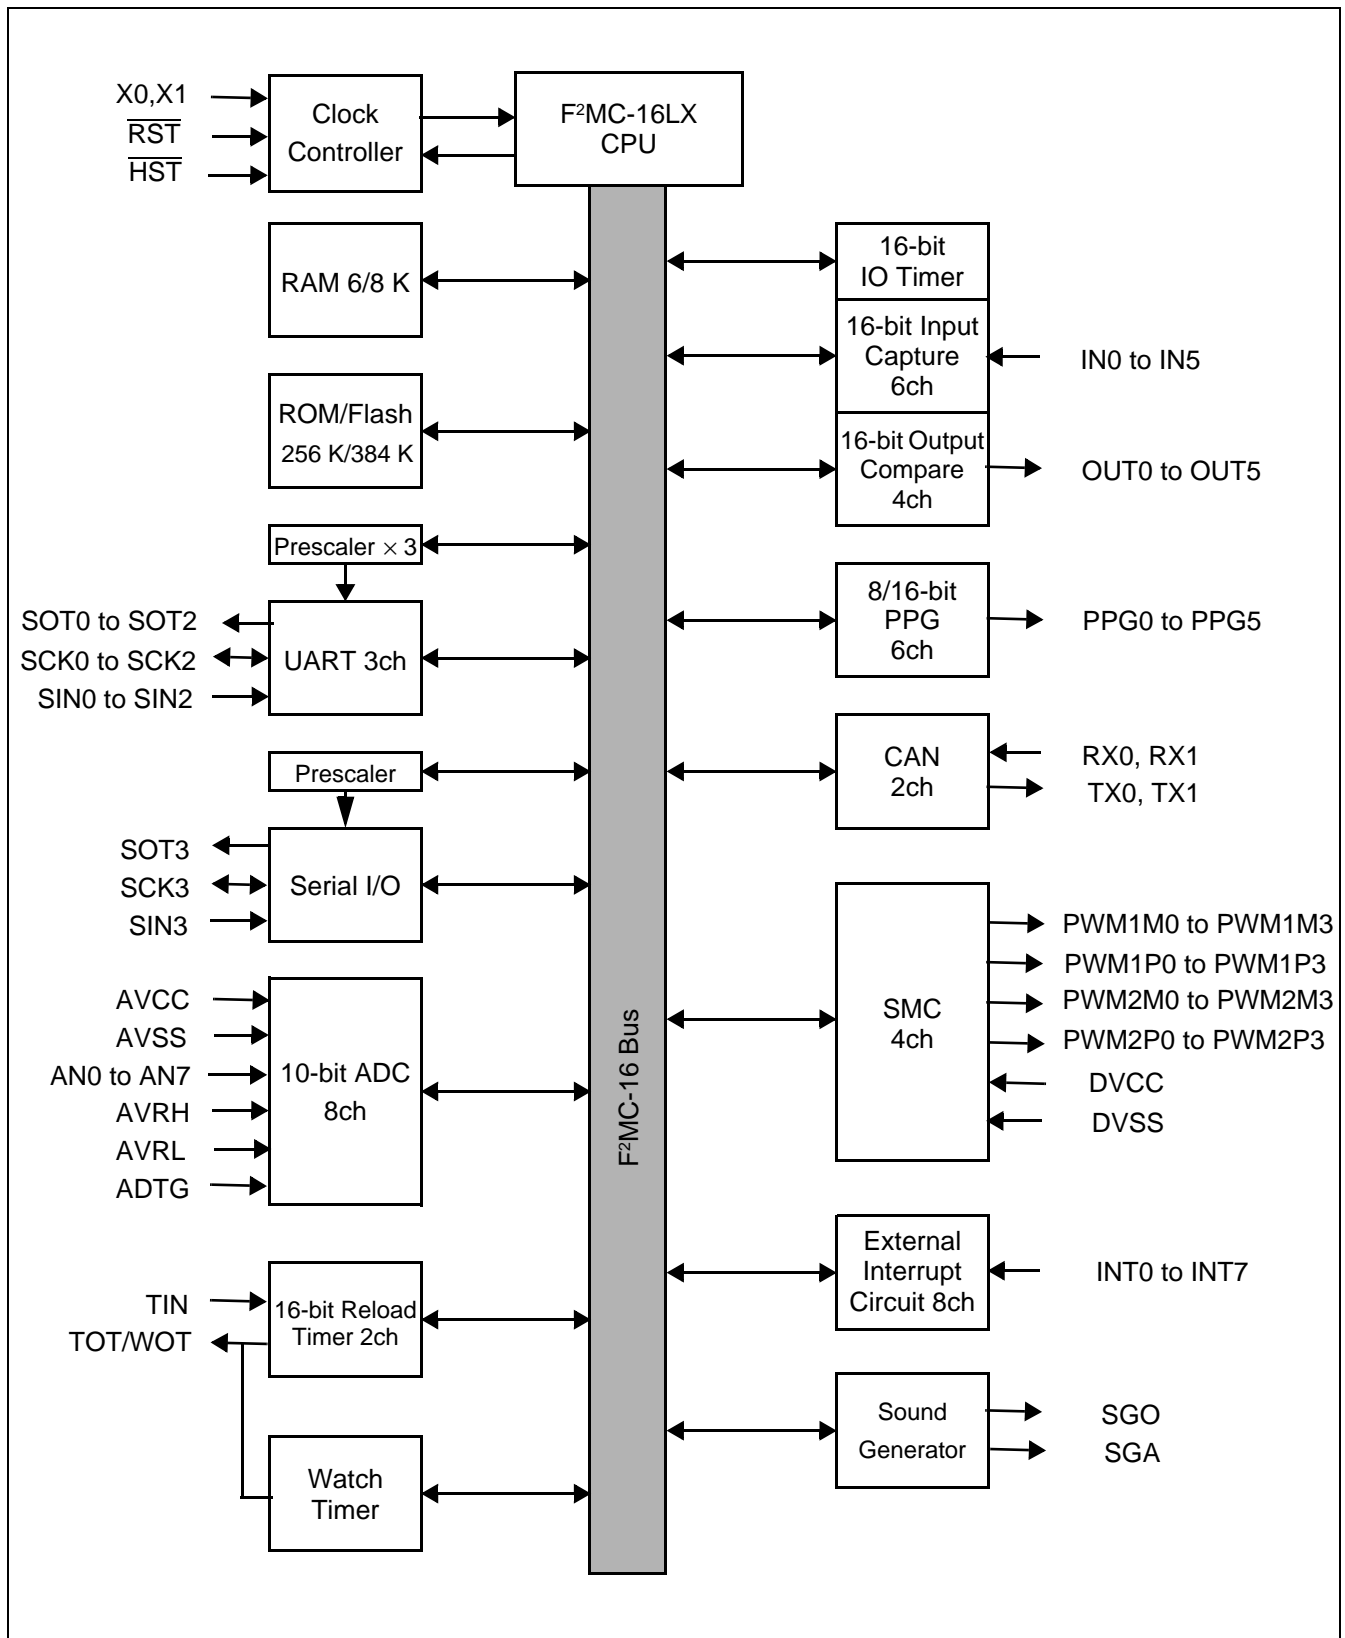

In the Signed multiplication and division instructions (“DIV A, Ri” and “DIVW A, RWi”), the value of the corresponding bank register (DTB, ADB, USB, SSB) is set in “00 H”.

If the values of the corresponding bank registers (DTB, ADB, USB, SSB) are set to other than “00 H”, the remainder by the execution result of the instruction is not stored in the register of the instruction operand.

(14) Using REALOS

The use of EI²OS is not possible with the REALOS real time operating system.

Memory space map

Note: The ROM data of bank FF is reflected in the upper address of bank 00, realizing effective use of the C compiler small model. The lower 16-bit of bank FF and the lower 16-bit of bank 00 are assigned to the same address, enabling reference of the table on the ROM without stating "far".

For example, if an attempt has been made to access 00C000_H, the contents of the ROM at FFC000_H are accessed. Since the ROM area of the FF bank exceeds 48 Kbytes, the whole area cannot be reflected in the image for the 00 bank. The ROM data at FF4000_H to FFFFFFF_H looks, therefore, as if it were the image for 004000_H to 00FFFF_H. Thus, it is recommended that the ROM data table be stored in the area of FF4000_H to FFFFFFF_H.

Note: Initial value of “_” represents unused bit; “X” represents unknown value.

Addresses in the range 0000_H to 00FF_H, which are not listed in the table, are reserved for the primary functions of the MCU. A read access to these reserved addresses results in reading “X”, and any write access should not be performed.

■ CAN CONTROLLERS

The CAN controller has the following features:

- Conforms to CAN Specification Version 2.0 Part A and B
 - Supports transmission/reception in standard frame and extended frame formats
- Supports transmission of data frames by receiving remote frames
- 16 transmitting/receiving message buffers
 - 29-bit ID and 8-byte data
 - Multi-level message buffer configuration
- Provides full-bit comparison, full-bit mask, acceptance register 0/acceptance register 1 for each message buffer as 1D acceptance mask
 - Two acceptance mask registers in either standard frame format or extended frame formats
- Bit rate programmable from 10 kbit/s to 2 Mbit/s (when input clock is at 16 MHz)

*1: The interrupt request flag is cleared by the I²OS interrupt clear signal.

*2: The interrupt request flag is cleared by the I²OS interrupt clear signal. A stop request is available.

N/A: The interrupt request flag is not cleared by the I²OS interrupt clear signal.

Note: • For a peripheral module with two interrupt for a single interrupt number, both interrupt request flags are cleared by the I²OS interrupt clear signal.

- At the end of I²OS, the I²OS clear signal will be asserted for all the interrupt flags assigned to the same interrupt number. If one interrupt flag starts the I²OS and in the meantime another interrupt flag is set by a hardware event, the later event is lost because the flag is cleared by the I²OS clear signal caused by the first event. So it is recommended not to use the I²OS for this interrupt number.
- If I²OS is enabled, I²OS is initiated when one of the two interrupt signals in the same interrupt control register (ICR) is asserted. This means that different interrupt sources share the same I²OS Descriptor which should be unique for each interrupt source. For this reason, when one interrupt source uses the I²OS, the other interrupt should be disabled.

*1: AV_{CC} , AVRL and AVRL should not exceed V_{CC} and AVRL should not exceed AVRH.

*2: V_I and V_O should not exceed $V_{CC} + 0.3V$. V_I should not exceed the specified ratings. However if the maximum current to/from an input is limited by some means with external components, the I_{CLAMP} rating supercedes the V_I rating.

*3: The maximum output current is a peak value for a corresponding pin.

*4: Average output current is an average current value observed for a 100 ms period for a corresponding pin.

*5: Total average current is an average current value observed for a 100 ms period for all corresponding pins.

Note: Average output current = operating current \times operating efficiency

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

*: Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The smoothing capacitor to be connected to the V_{CC} pin must have a capacitance value higher than C_S .

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

(1) Clock Timing

(MB90V590A, MB90F594A, MB90594, MB90V590G, MB90F594G, MB90594G:
 $V_{CC} = 5.0 \text{ V} \pm 10\%$, $V_{SS} = AV_{SS} = 0\text{V}$, $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$)
 (MB90F591A, MB90591: $V_{CC} = 5.0 \text{ V} \pm 5\%$, $V_{SS} = AV_{SS} = 0\text{V}$, $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$)

Parameter	Symbol	Pin name	Value			Unit	Remarks
			Min.	Typ.	Max.		
Oscillation frequency	f_c	X0, X1	3	—	5	MHz	When using an oscillation circuit.
			3	—	16	MHz	When using an external clock.
Oscillation cycle time	t_{CYL}	X0, X1	200	—	333	ns	When using an oscillation circuit.
			62.5	—	333	ns	When using an external clock.
Frequency deviation with PLL*	Δf	—	—	—	5	%	
Input clock pulse width	P_{WH}, P_{WL}	X0	10	—	—	ns	Duty ratio is about 30 to 70%.
Input clock rise and fall time	t_{CR}, t_{CF}	X0	—	—	5	ns	When using external clock
Machine clock frequency	f_{CP}	—	1.5	—	16	MHz	
Machine clock cycle time	t_{CP}	—	62.5	—	666	ns	
Flash read cycle time	t_{CYCFL}	—	—	$2 t_{CP}$	—	ns	When Flash is accessed by CPU

*: Frequency deviation indicates the maximum frequency difference from the target frequency when using a multiplied clock.

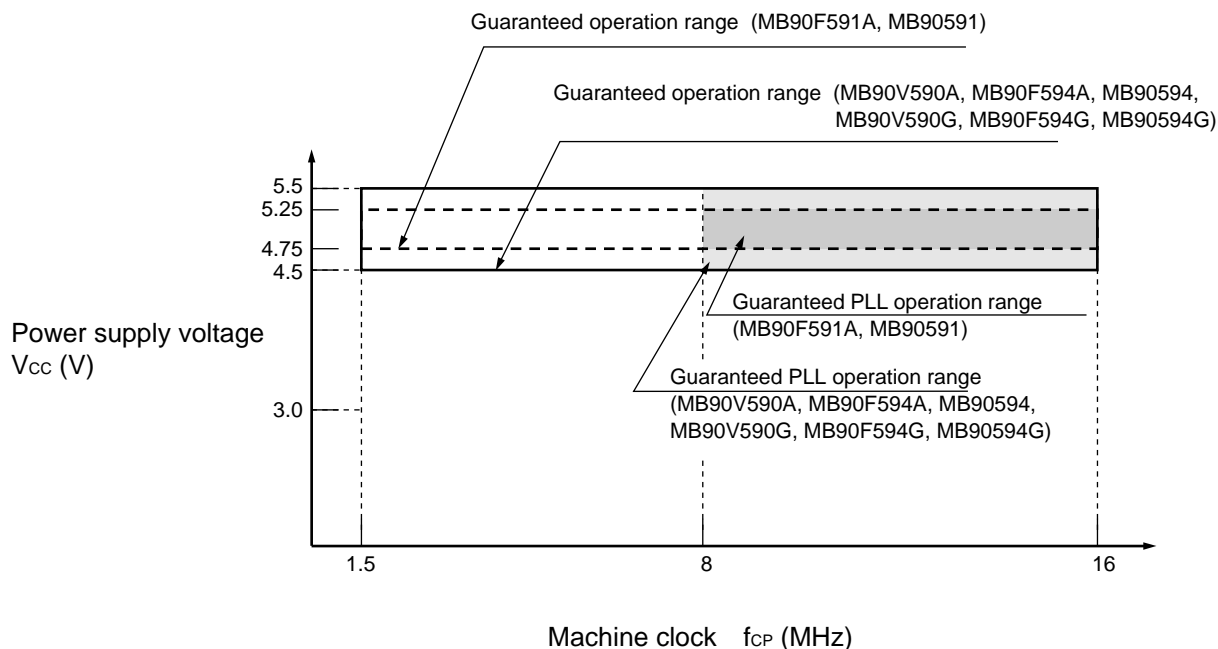

Example of Oscillation circuit

MB90590/590G Series

• Guaranteed operation range

• External clock frequency and machine clock frequency

*: When using the oscillation circuit, the maximum oscillation clock frequency is 5 MHz.

(2) Reset and Hardware Standby Input

(MB90V590A, MB90F594A, MB90594, MB90V590G, MB90F594G, MB90594G:

$V_{CC} = 5.0 \text{ V} \pm 10 \%$, $V_{SS} = AV_{SS} = 0 \text{ V}$, $T_A = -40^\circ \text{C}$ to $+85^\circ \text{C}$)

(MB90F591A, MB90591: $V_{CC} = 5.0 \text{ V} \pm 5 \%$, $V_{SS} = AV_{SS} = 0 \text{ V}$, $T_A = -40^\circ \text{C}$ to $+85^\circ \text{C}$)

Parameter	Symbol	Pin name	Value		Unit	Remarks
			Min.	Max.		
Reset input time	t_{RSTL}	\overline{RST}	$16 t_{CP}^{*1}$	—	ns	Under normal operation
			Oscillation time of oscillator ^{*2} + $16 t_{CP}^{*1}$	—	ms	In stop mode
Hardware standby input time	t_{HSTL}	\overline{HST}	$16 t_{CP}^{*1}$	—	ns	Under normal operation
			Oscillation time of oscillator ^{*2} + $16 t_{CP}^{*1}$	—	ms	In stop mode

*1: " t_{CP} " represents one cycle time of the machine clock.

No reset can fully initialize the Flash Memory if it is performing the automatic algorithm.

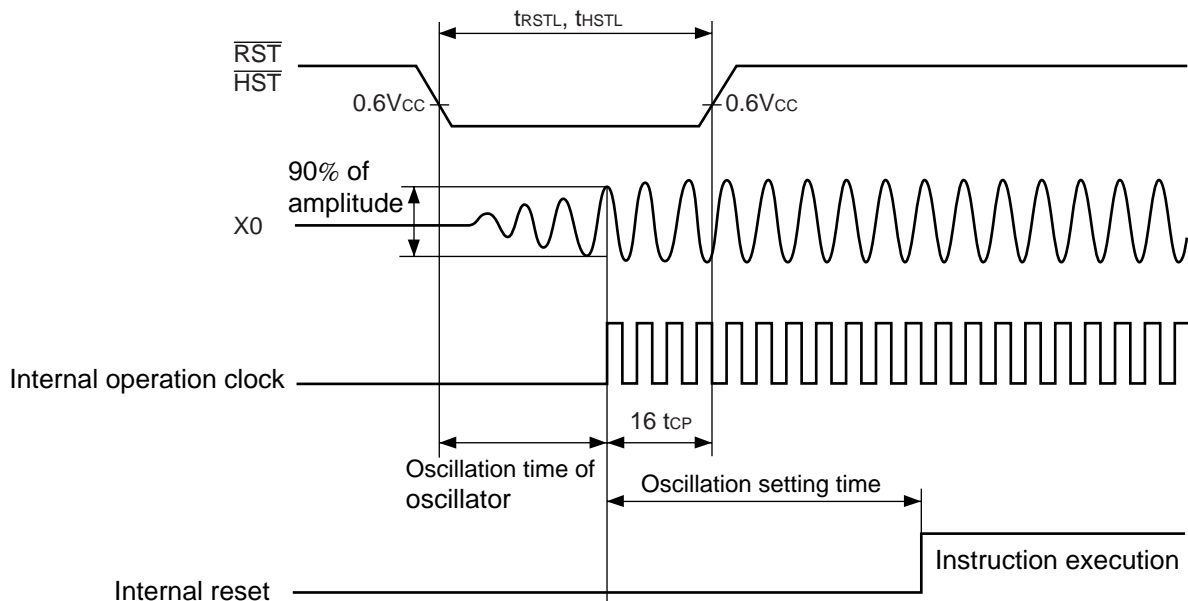

*2: Oscillation time of oscillator is time that the amplitude reached the 90%.

In the crystal oscillator, the oscillation time is between several ms to tens of ms. In FAR / ceramic oscillator, the oscillation time is between hundreds of μs to several ms. In the external clock, the oscillation time is 0 ms.

(3) Power On Reset

(MB90V590A, MB90F594A, MB90594, MB90V590G, MB90F594G, MB90594G:

$V_{CC} = 5.0 \text{ V} \pm 10 \%$, $V_{SS} = AV_{SS} = 0 \text{ V}$, $T_A = -40^\circ \text{C}$ to $+85^\circ \text{C}$)

(MB90F591A, MB90591: $V_{CC} = 5.0 \text{ V} \pm 5 \%$, $V_{SS} = AV_{SS} = 0 \text{ V}$, $T_A = -40^\circ \text{C}$ to $+85^\circ \text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Power on rise time	t_R	V_{CC}	—	0.05	30	ms	
Power off time	t_{OFF}	V_{CC}		50	—	ms	Due to repetitive operation

- Note
- V_{CC} must be kept lower than 0.2 V before power-on.
 - The above values are used for creating a power-on reset.
 - Some registers in the device are initialized only upon a power-on reset. To initialize these register, turn on the power supply using the above values.

Sudden changes in the power supply voltage may cause a power-on reset.

To change the power supply voltage while the device is in operation, it is recommended to raise the voltage smoothly to suppress fluctuations as shown below.

In this case, change the supply voltage with the PLL clock not used. If the voltage drop is 1 V or fewer per second, however, you can use the PLL clock.

(4) UART0/1/2, Serial I/O

6. A/D Converter Glossary

Resolution: Analog changes that are identifiable with the A/D converter

Linearity error: The deviation of the straight line connecting the zero transition point ("00 0000 0000" ↔ "00 0000 0001") with the full-scale transition point ("11 1111 1110" ↔ "11 1111 1111") from actual conversion characteristics

Differential linearity error: The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value

Total error: The total error is defined as a difference between the actual value and the theoretical value, which includes zero-transition error/full-scale transition error and linearity error.

$$1 \text{ LSB} = (\text{Theoretical value}) \frac{\text{AVRH} - \text{AVRL}}{1024} [\text{V}]$$

$$V_{0T} (\text{Theoretical value}) = \text{AVRL} + 0.5 \text{ LSB} [\text{V}]$$

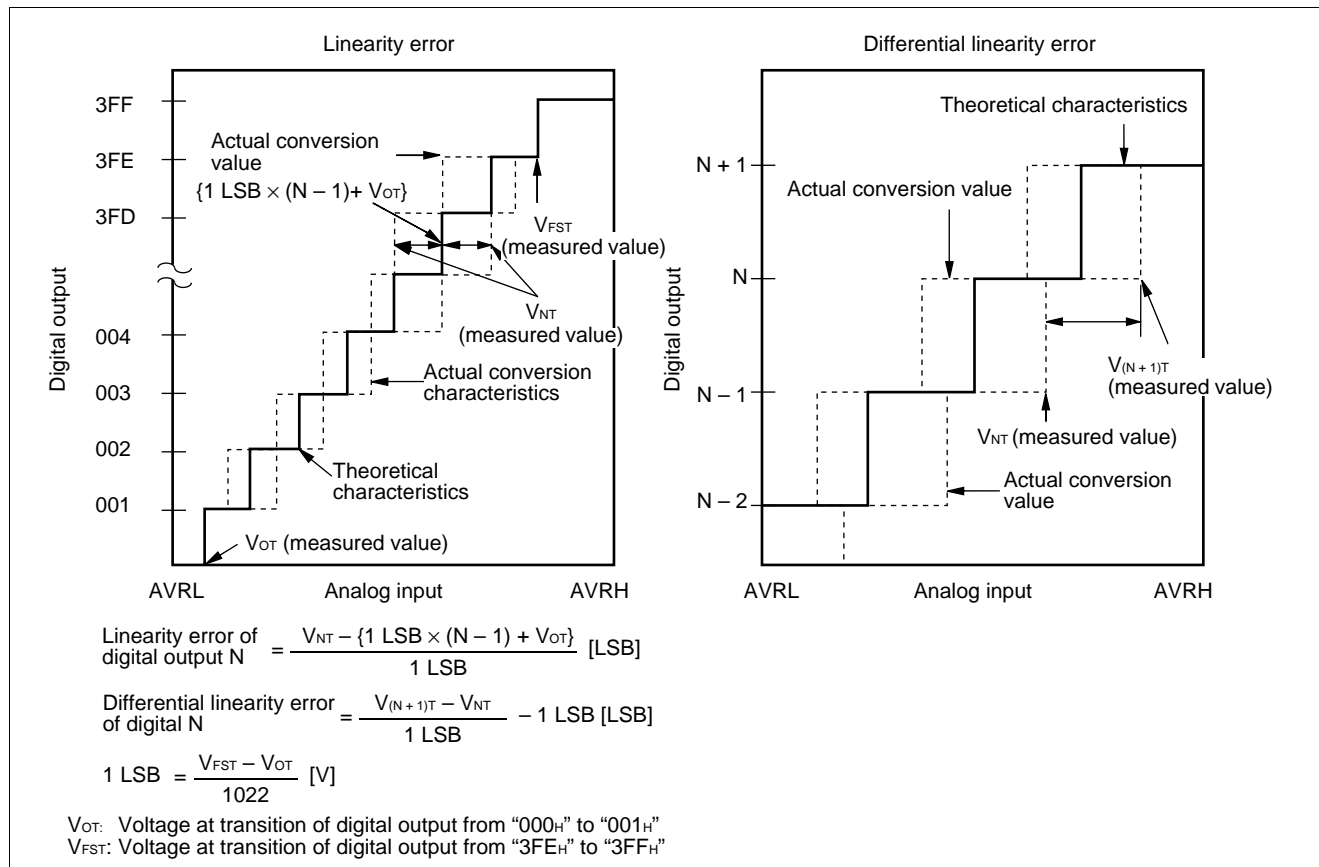

$$V_{FST} (\text{Theoretical value}) = \text{AVRH} - 1.5 \text{ LSB} [\text{V}]$$

$$\text{Total error for digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + 0.5 \text{ LSB}\}}{1 \text{ LSB}} [\text{LSB}]$$

V_{NT}: Voltage at a transition of digital output from (N - 1) to N

7. Notes on Using A/D Converter

Select the output impedance value for the external circuit of analog input according to the following conditions, :

- Output impedance values of the external circuit of 15 kΩ or lower are recommended.
- When capacitors are connected to external pins, the capacitance of several thousand times the internal capacitor value is recommended to minimized the effect of voltage distribution between the external capacitor and internal capacitor.

When the output impedance of the external circuit is too high, the sampling period for analog voltages may not be sufficient (sampling period = 4.00 μs @ machine clock of 16 MHz).

• Equipment of analog input circuit model

Note: Listed values must be considered as standards.

• Error

The smaller the $|AVRH - AVRL|$, the greater the error would become relatively.
